

# ISTN212: Databases

## Chapter 5: Beginning Structured Query Language

# What is SQL ?

- It is a DDL – Data Definition Language
  - Allows for the creation of DB objects and defines access rights to those objects
- It is a DML – Data Manipulation Language
  - Allows for manipulation of data within DB
- Easy to learn with command set of < 100 words
- Several SQL dialects (Oracle, MS SQL server, IBM)

**TABLE  
7.1**

## SQL Data Definition Commands

COMMAND OR OPTION	DESCRIPTION
CREATE SCHEMA AUTHORIZATION	Creates a database schema
CREATE TABLE	Creates a new table in the user's database schema
NOT NULL	Ensures that a column will not have null values
UNIQUE	Ensures that a column will not have duplicate values
PRIMARY KEY	Defines a primary key for a table
FOREIGN KEY	Defines a foreign key for a table
DEFAULT	Defines a default value for a column (when no value is given)
CHECK	Constraint used to validate data in an attribute
CREATE INDEX	Creates an index for a table
CREATE VIEW	Creates a dynamic subset of rows/columns from one or more tables
ALTER TABLE	Modifies a table's definition (adds, modifies, or deletes attributes or constraints)
CREATE TABLE AS	Creates a new table based on a query in the user's database schema
DROP TABLE	Permanently deletes a table (and thus its data)
DROP INDEX	Permanently deletes an index
DROP VIEW	Permanently deletes a view

**TABLE  
7.2**

## SQL Data Manipulation Commands

COMMAND OR OPTION	DESCRIPTION
INSERT	Inserts row(s) into a table
SELECT	Selects attributes from rows in one or more tables or views
WHERE	Restricts the selection of rows based on a conditional expression
GROUP BY	Groups the selected rows based on one or more attributes
HAVING	Restricts the selection of grouped rows based on a condition
ORDER BY	Orders the selected rows based on one or more attributes
UPDATE	Modifies an attribute's values in one or more table's rows
DELETE	Deletes one or more rows from a table
COMMIT	Permanently saves data changes
ROLLBACK	Restores data to their original values

**TABLE  
7.2**

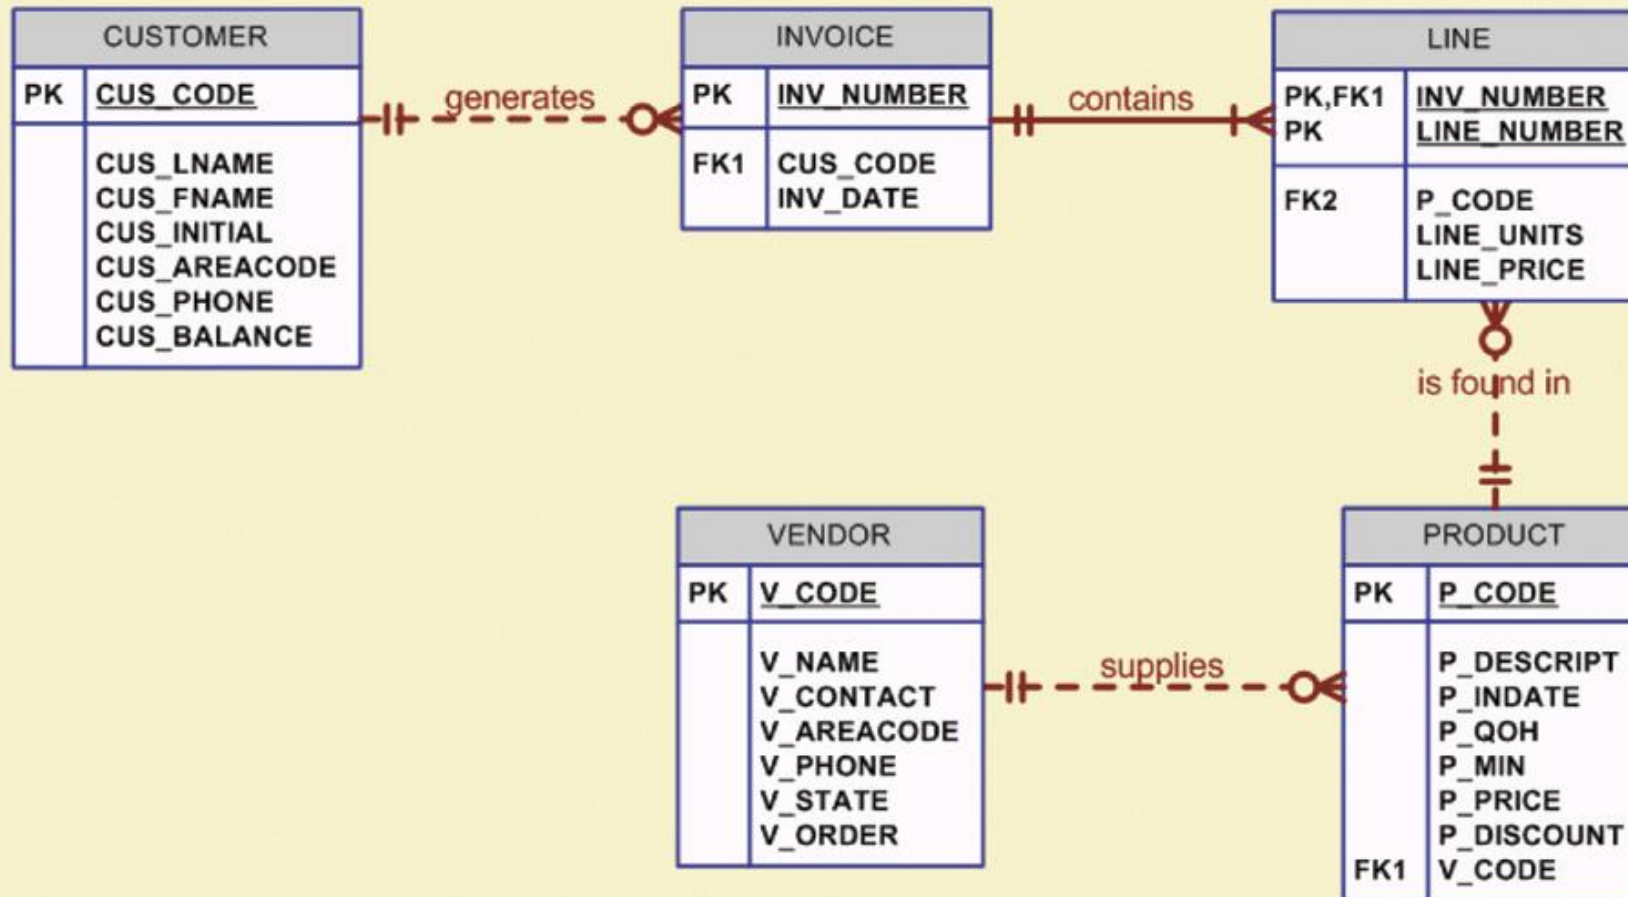

## SQL Data Manipulation Commands (continued)

COMMAND OR OPTION	DESCRIPTION
<b>COMPARISON OPERATORS</b>	
=, <, >, <=, >=, <>	Used in conditional expressions
<b>LOGICAL OPERATORS</b>	
AND/OR/NOT	Used in conditional expressions
<b>SPECIAL OPERATORS</b>	Used in conditional expressions
BETWEEN	Checks whether an attribute value is within a range
IS NULL	Checks whether an attribute value is null
LIKE	Checks whether an attribute value matches a given string pattern
IN	Checks whether an attribute value matches any value within a value list
EXISTS	Checks whether a subquery returns any rows
DISTINCT	Limits values to unique values
<b>AGGREGATE FUNCTIONS</b>	Used with SELECT to return mathematical summaries on columns
COUNT	Returns the number of rows with non-null values for a given column
MIN	Returns the minimum attribute value found in a given column
MAX	Returns the maximum attribute value found in a given column
SUM	Returns the sum of all values for a given column
AVG	Returns the average of all values for a given column

# Example: Database Model

FIGURE 7.1  
The database model

# Creating the DB

- Two tasks must be completed
  1. Create the DB structure
  2. Create the tables that will hold the data
- RDBMS creates physical files that will hold the DB
- Data dictionary is automatically created to hold metadata
- Setup is often different between RDBMS's

# Data types

- Determined by the nature of the data and intended use of data
- Must pay close attention to expected use of attributes for sorting and data retrieval purposes

TABLE  
5.4

Some Common SQL Data Types

DATA TYPE	FORMAT	COMMENTS
Numeric	NUMBER(L,D)	The declaration NUMBER(7,2) indicates that numbers will be stored with two decimal places and may be up to seven digits long, including the sign and the decimal place (for example, 12.32 or -134.99).
	INTEGER	May be abbreviated as INT. Integers are (whole) counting numbers, so they cannot be used if you want to store numbers that require decimal places.
	SMALLINT	Like INTEGER but limited to integer values up to six digits. If your integer values are relatively small, use SMALLINT instead of INT.
	DECIMAL(L,D)	Like the NUMBER specification, but the storage length is a <i>minimum</i> specification. That is, greater lengths are acceptable, but smaller ones are not. DECIMAL(9,2), DECIMAL(9), and DECIMAL are all acceptable.
Character	CHAR(L)	Fixed-length character data for up to 255 characters. If you store strings that are not as long as the CHAR parameter value, the remaining spaces are left unused. Therefore, if you specify CHAR(25), strings such as <i>Smith</i> and <i>Katzenjammer</i> are each stored as 25 characters. However, a U.S. area code is always three digits long, so CHAR(3) would be appropriate if you wanted to store such codes.
	VARCHAR(L) or VARCHAR2(L)	Variable-length character data. The designation VARCHAR2(25) will let you store characters up to 25 characters long. However, VARCHAR will not leave unused spaces. Oracle automatically converts VARCHAR to VARCHAR2.
Date	DATE	Stores dates in the Julian date format.

# Creating a Table Structure using SQL

```
CREATE TABLE tablename (  
    column1 data type [constraint] [,  
    column2 data type [constraint] [,  
    PRIMARY KEY (column1 [,column2]) ] [,  
    FOREIGN KEY (column1 [, column2]) REFERENCES tablename] [,  
    CONSTRAINT constraint ]);
```

# Example: Creating a table of Products

```
CREATE TABLE PRODUCT (  
  P_CODE      VARCHAR(10)  NOT NULL  UNIQUE,  
  P_DESCRIPT  VARCHAR(35)  NOT NULL,  
  P_INDATE   DATE          NOT NULL,  
  P_QOH      SMALLINT     NOT NULL,  
  P_MIN      SMALLINT     NOT NULL,  
  P_PRICE    NUMBER(8,2)   NOT NULL,  
  P_DISCOUNT NUMBER(4,2)  NOT NULL,  
  V_CODE     INTEGER,  
  PRIMARY KEY (P_CODE),  
  FOREIGN KEY (V_CODE) REFERENCES VENDOR ON UPDATE CASCADE);
```

May not be necessary  
depending on which  
RDBMS being used

# Example: Creating a table of customer

```
CREATE TABLE CUSTOMER(  
  CUS_CODE NUMBER PRIMARY KEY,  
  CUS_LNAME VARCHAR(15) NOT NULL,  
  CUS_FNAME VARCHAR(15) NOT NULL,  
  CUS_INITIAL CHAR(1),  
  CUS_AREACODE CHAR(3) DEFAULT '615' NOT NULL  
    CHECK (CUS_AREACODE IN  
      ('615', '713', '931')),  
  CUS_PHONE CHAR(12) NOT NULL,  
  CUS_BALANCE NUMBER(9,2) DEFAULT 0.00  
  CONSTRAINT CUS_UI1 UNIQUE (CUS_LNAME, CUS_FNAME));
```

# Some suggestions and things to note

- Use one line per column (attribute) definition
- Use spaces to line up attribute characteristics and constraints
- Table and attribute names are capitalized
- NOT NULL specification – Blanks not allowed
- UNIQUE specification – No duplicates
- DEFAULT – Can provide a default value if user does not enter any value
- CHECK – Validates data and ensures that only certain values are accepted

# Some suggestions and things to note

- `CONSTRAINT CUS_UI1 UNIQUE (CUS_LNAME, CUS_FNAME));`
  - Unique index created called CUS\_UI1
  - Prevents two customers with same first name and last name
    - NOT RECOMMENDED as there can be more than one John Smith
- Primary key attributes contain both a NOT NULL and a UNIQUE specification
- RDBMS will automatically enforce referential integrity for foreign keys
  - a condition by which a dependent table's foreign key must have either a null entry or a matching entry in the related table
- Command sequence ends with semicolon

# Indexes

- Covered in Chapter 4, it is an orderly arrangement used to logically access rows in a table
- When primary key is declared, DBMS automatically creates unique index
- Often need additional indexes
- Using CREATE INDEX command, SQL indexes can be created on basis of any selected attribute
- Composite index
  - Index based on two or more attributes
  - Often used to prevent data duplication

# Indexes

```
CREATE [UNIQUE] INDEX indexname ON tablename(column1  
[,column2])
```

- P\_INDATE stored in the PRODUCT table
- To create an index:

```
CREATE INDEX P_INDATEX ON PRODUCT(P_INDATE);
```

- to delete an index, use the drop index command:

```
DROP INDEX indexname
```

# Indexes

TABLE  
7.5

A Duplicated Test Record

EMP_NUM	TEST_NUM	TEST_CODE	TEST_DATE	TEST_SCORE
110	1	WEA	15-May-2005	93
110	2	WEA	12-May-2005	87
111	1	HAZ	14-Dec-2005	91
111	2	WEA	18-Feb-2006	95
111	3	WEA	18-Feb-2006	95
112	1	CHEM	17-Aug-2005	91

- An employee can take a test ONLY once on a given date
- PK is combination of EMP\_NUM and TEST\_NUM
- Problem since WEA test taken twice by EMP 111 on 18 Feb 2006
- By creating a unique index – combo of EMP\_NUM, TEST\_CODE and TEST\_DATE, problem can be avoided

```
CREATE UNIQUE INDEX EMP_TESTDEX ON TEST(EMP_NUM,  
TEST_CODE, TEST_DATE);
```

# Data Manipulation Commands

- Adding table rows
- Saving table changes
- Listing table rows
- Updating table rows
- Restoring table contents
- Deleting table rows
- Inserting table rows with a select subquery

# Adding Table Rows (Adding data to tables)

- INSERT - Used to enter data into table
- Syntax:

```
INSERT INTO tablename  
VALUES (value1, value2, ... , valuen);
```

- Example:

```
INSERT INTO PRODUCT  
VALUES ('11QER/31', 'blade 3-nozzle', .....);
```

# Adding Table Rows (Adding data to tables)

- When entering values:
  - Row contents are entered between parentheses
  - Character and date values are entered between apostrophes
  - Numerical entries are not enclosed in apostrophes
  - Attribute entries are separated by commas
  - A value is required for each column
- Use NULL for unknown values

# Saving table changes using COMMIT

- Changes made to table contents are not physically saved on disk until, one of the following occurs:
  - Database is closed
  - Program is closed
  - COMMIT command is used
- Syntax:
  - COMMIT [WORK];
- Will permanently save any changes made to any table in the database
- MS Access does not support the COMMIT command

# Listing table rows

- SELECT - Used to list contents of table
- Syntax:

```
SELECT column1, column2 etc.  
FROM tablename;
```

- One or more attributes, separated by commas
- Example

```
SELECT P_CODE, P_QOH FROM PRODUCT
```

- Asterisk can be used as wildcard character to list all attributes
  - `SELECT * FROM tablename;`

# Updating the table data

- UPDATE - Modify data in a table
- Syntax:

```
UPDATE tablename  
SET columnname = expression [, columnname = expression]  
[WHERE conditionlist];
```

- If more than one attribute is to be updated in row, separate corrections with commas

```
UPDATE PRODUCT  
SET P_INDATE = '18-JAN-2006',  
    P_PRICE = 17.99, P_MIN = 10  
WHERE P_CODE = '13-Q2/P2';
```

# Restoring Table Contents

- ROLLBACK
  - Used to restore database to its previous condition
  - Only applicable if COMMIT command has not been used to permanently store changes in database
- Syntax:
  - ROLLBACK;
- COMMIT and ROLLBACK only work with data manipulation commands that are used to add, modify, or delete table rows

# Deleting rows from a table (Deleting data)

- DELETE - Deletes a table row
- Syntax:

DELETE FROM *tablename*  
[WHERE *conditionlist* ];

- WHERE condition is optional
- If WHERE condition is not specified, all rows from specified table will be deleted

```
DELETE FROM PRODUCT  
WHERE P_MIN = 5;
```

# Inserting Table Rows with a Select Statement

- To Insert multiple rows from another table (source)
- Use INSERT with a SELECT subquery
  - Query that is embedded (or nested) inside another query is executed first
- Syntax:

INSERT INTO *tablename* SELECT *columnlist* FROM *tablename*;

INSERT INTO PRODUCT SELECT \* FROM P;

- Takes all data from all attributes from table P and inserts them into table PRODUCT

# Selecting Rows with Conditional Restrictions

- Select partial table contents by placing restrictions on rows to be included in output
  - Add conditional restrictions to SELECT statement, using WHERE clause
  - Can use comparison operators
- Syntax:

```
SELECT columnlist  
FROM tablelist  
[ WHERE conditionlist ] ;
```

TABLE  
7.6

Comparison Operators

SYMBOL	MEANING
=	Equal to
<	Less than
<=	Less than or equal to
>	Greater than
>=	Greater than or equal to
<> or !=	Not equal to

**Selected PRODUCT table  
attributes: the logical AND  
and OR**

	P_DESCRIPT	P_INDATE	P_PRICE	V_CODE
►	B&D jigsaw, 12-in. blade	30-Dec-05	109.92	24288
	B&D jigsaw, 8-in. blade	24-Dec-05	99.87	24288
	B&D cordless drill, 1/2-in.	20-Jan-06	38.95	25595
	Claw hammer	20-Jan-06	9.95	21225
	Hicut chain saw, 16 in.	07-Feb-06	256.99	24288
	PVC pipe, 3.5-in., 8-ft.	20-Feb-06	5.87	
	1.25-in. metal screw, 25	01-Mar-06	6.99	21225
	2.5-in. wdl. screw, 50	24-Feb-06	8.45	21231

```
SELECT P_DESCRIPT, P_INDATE, P_PRICE, V_CODE
FROM PRODUCT
WHERE (P_PRICE < 50 AND P_INDATE > '15-Jan-2006')
OR V_CODE = 24288;
```

# Special operators

- BETWEEN - Used to check whether attribute value is within a range

```
SELECT * FROM PRODUCT
```

```
WHERE P_PRICE BETWEEN 50.00 AND 100.00
```

- IS NULL - Used to check whether attribute value is null

```
SELECT P_CODE, P_DESCRIPT, V_CODE
```

```
FROM PRODUCT
```

```
WHERE V_CODE IS NULL;
```

# Special Operators

- LIKE - Used to check whether attribute value matches given string pattern

```
SELECT V_NAME, V_CONTACT  
FROM VENDOR
```

```
WHERE V_CONTACT LIKE 'Smith%'
```

- Wildcard string search based on the string '\_m%' can yield the string Am, Amber, Crumpets....
  - In MS Access
    - \* matches with zero or more characters
    - ? matches with just one character
  - In other SQLs,
    - % matches with zero or more characters
    - \_ (underscore) matches with just one character

# Special Operators

- IN - Used to check whether attribute value matches any value within a value list

```
SELECT * FROM PRODUCT  
WHERE V_CODE IN (21344, 24288)
```

- EXISTS
  - Used to check if subquery returns any rows
  - discussed in next chapter

# Additional Data Definition Commands

- All changes in table structure are made by using ALTER command
  - Followed by keyword that produces specific change
  - Following three options are available:
    - ADD
    - MODIFY
    - DROP
  - Can be used to change data type or add columns etc.

```
ALTER TABLE PRODUCT  
MODIFY (V_CODE CHAR(5));
```

```
ALTER TABLE PRODUCT  
ADD (P_SALECODE CHAR(1));
```

# Advanced Data Updates

```
UPDATE PRODUCT  
SET P_QOH = P_QOH + 20  
WHERE P_CODE = '2232/QWE';
```

```
UPDATE PRODUCT  
SET P_PRICE = P_PRICE * 1.10  
WHERE P_PRICE < 50.00;
```

# Copying data from one table to another

- SQL permits copying contents of selected table columns so that the data need not be reentered manually into newly created table(s)
- First create the PART table structure

```
CREATE TABLE PART(  
PART_CODE          CHAR(8)  
PART_DESCRIPT      CHAR(35),  
PART_PRICE         DECIMAL(8,2),  
V_CODE             INTEGER,  
PRIMARY KEY (PART_CODE));
```

# Copying data from one table to another

- Next add rows to new PART table using PRODUCT table rows

```
INSERT INTO PART (PART_CODE, PART_DESCRIPT, PART_PRICE, V_CODE)  
SELECT P_CODE, P_DESCRIPT, P_PRICE, V_CODE FROM PRODUCT;
```

- Can also rapidly create new table based on selected columns and rows of an existing table
- **In oracle (new table copies the attribute name, data characteristics and rows of original table**

```
CREATE TABLE PART AS  
SELECT P_CODE AS PART_CODE, P_DESCRIPT AS  
PART_DESCRIPT, P_PRICE AS PART_PRICE, V_CODE  
FROM PRODUCT;
```

# Adding Primary and Foreign Key Designations

- When table is copied, integrity rules do not copy, so primary and foreign keys need to be manually defined on new table
- User ALTER TABLE command - Syntax:

```
ALTER TABLE tablename ADD  
PRIMARY KEY(fieldname);
```

- For foreign key, use FOREIGN KEY in place of PRIMARY KEY

# Deleting a Table from the Database

- DROP - Deletes table from database
- Syntax:

DROP TABLE *tablename*;

# Advanced Select Queries

- SQL provides useful functions that can:
  - Count
  - Find minimum and maximum values
  - Calculate averages
  - Distinct

# Ordering a listing

- The order by clause is especially useful when listing order in important
- The syntax is:

SELECT columnlist

FROM tablelist

WHERE conditionlist ]

ORDER BY columnlist [ASC | DESC]);

- Although you have an option of declaring the order type – ascending or descending – the default value is ascending

# Aggregate Functions

**TABLE 7.8** Some Basic SQL Aggregate Functions

<b>FUNCTION</b>	<b>OUTPUT</b>
COUNT	The number of rows containing non-null values
MIN	The minimum attribute value encountered in a given column
MAX	The maximum attribute value encountered in a given column
SUM	The sum of all values for a given column
AVG	The arithmetic mean (average) for a specified column

# Count

- Function used to tally the number of non-null values of an attribute
- E.g. need to know how many vendors in the product tables
- Function uses one parameter within brackets
  - COUNT(V\_CODE)
- Parameter may also be an expression
  - COUNT(DISTINCT P\_CODE), COUNT(P\_PRICE + 10)
- COUNT(\*) returns the total number of rows including rows that contain nulls

```
SELECT COUNT(*)
```

```
FROM (SELECT DISTINCT V_CODE FROM PRODUCT WHERE V_CODE IS  
      NOT NULL);
```

- Table used for count example

Ordertable : Table					
	orderid	oderdate	orderprice	orderquantity	customername
▶	1	2005/12/22	R 160.00	2	smith
	2	2005/08/10	R 190.00	2	Johnson

# Grouping Data

- Forms groups of rows with same value of some columns
- The syntax is:

SELECT **columnlist**

FROM **tablelist**

WHERE **conditionlist**

GROUP BY **columnlist**

HAVING **conditionlist**

ORDER BY **columnlist** [**ASC** | **DESC**];

- GROUP BY is valid only in conjunction with one of the SQL aggregate functions, such as COUNT, MIN, MAX, AVG, SUM
