Chapter 6: Procedural Language
SQL and Advanced SQL

SQL Join Operators

- Ability to combine (join) tables on common attributes is most important distinction between relational database and other databases
- Join is performed when data are retrieved from more than one table at a time
- Join is generally composed of an equality comparison between foreign key and primary key of related tables

TABLE 7.9 Creating Links Through Foreign Keys

TABLE	ATTRIBUTES TO BE SHOWN	LOOKING ATTRIBUTE
PRODUCT	P. DESCRIPT, P. PRICE	V. CODE
VENDOR	V. COMPANY, V. PHONE	V. CODE

JOIN

- Allows us to combine information from two or more tables. Join is the real power behind relational database, allowing the use of independent tables linked by common attributes.

CUS_CODE	CUS_LNAME	CUS_ZIP	AGENT_CODE
102445	Wahler	32145	231
1217782	Adams	32145	125

FIGURE 2.11 TWO TABLES THAT WILL BE USED IN JOIN ILLUSTRATIONS

JOIN

- Many types of JOINS

JOIN

- Links tables by selecting rows with common values in common attribute(s)
- Three-stage process
- Creates ONE table
- Stage 1: Apply Product relational operator
- Stage 2: Select yields appropriate rows
- Stage 3: Project removes any duplicate columns

CUS_CODE	CUS_LNAME	CUS_ZIP	CUSTOMER.AGENT_CODE	AGENT.AGENT_CODE	AGENT_PHONE
102445	Wahler	32145	231	125	6152439887

Steel roofing, 42-in. x 12-in., 5" mesh	119.85	Rubicon Systems	Orton	904	456-0952

```

SELECT P_DESCRPT, P_PRICE, V_NAME, V_CONTACT,
       V_AREACODE, V_PHONE
FROM PRODUCT, VENDOR
WHERE PRODUCT.V_CODE = VENDOR.V_CODE
ORDER BY P_PRICE;

```

Will order by Price

JOINing more than two tables

- You need to specify a join condition for each pair of tables
- Number of join will always be N-1, where N represents the number of tables in the from clause
- Eg. Have three tables, you have 2 join clause

```

SELECT CUS_LNAME, INV_NUMBER, INV_DATE, P_DESCRPT
FROM CUSTOMER, INVOICE, LINE, PRODUCT
WHERE CUSTOMER.CUS_CODE = INVOICE.CUS_CODE
AND INVOICE.INV_NUMBER = LINE.INV_NUMBER
AND LINE.P_CODE = PRODUCT.P_CODE
AND CUSTOMER.CUS_CODE = 10014

```

JOINing tables with an ALIAS

- Alias can be used to identify source table
- Any legal table name can be used as alias – Reduces typing
- Add alias after table name in FROM clause

```

FROM tablename alias
SELECT P_DESCRPT, P_PRICE, V_NAME, V_CONTACT, V_AREACODE, V_PHONE
FROM PRODUCT P, VENDOR V
WHERE P.V_CODE = V.V_CODE
ORDER BY P_PRICE;

```

Natural JOIN

- Returns all rows with matching values in the matching columns
 - Eliminates duplicate columns
- Used when tables share one or more common attributes with common names
- Natural joins may cause problems if columns are added or renamed.
- Syntax:
 - SELECT column-list FROM table1 NATURAL JOIN table2

```

SELECT dname, ename FROM dept NATURAL JOIN emp
-- This is the same as an equi join on (emp.deptno = dept.deptno)
SELECT INV_NUMBER, P_CODE, P_DESCRPT, LINE_UNITS, LINE_PRICE
FROM INVOICE NATURAL JOIN LINE NATURAL JOIN PRODUCT;

```

JOIN USING Clause

- Returns only rows with matching values in the column indicated in the USING clause
- Syntax:

```
SELECT column-list FROM table1 JOIN table2 USING (common-column)
```

```
SELECT INV_NUMBER, P_CODE, P_DESCRPT, LINE_UNITS, LINE_PRICE
FROM INVOICE JOIN LINE
USING (INV_NUMBER) JOIN PRODUCT USING (P_CODE);
```

JOIN ON Clause

- Used when tables have no common attributes name
- Returns only rows that meet the join condition
 - Typically includes equality comparison expression of two columns
- Syntax:

```
SELECT column-list FROM table1 JOIN table2 ON join-condition
```

```
SELECT INV_NUMBER, P_CODE, P_DESCRPT, LINE_UNITS, LINE_PRICE
FROM INVOICE JOIN LINE
ON INVOICE.INV_NUMBER = LINE.INV_NUMBER JOIN PRODUCT ON
LINE.P_CODE = PRODUCT.P_CODE;
```

OUTER JOINS

- outer joins returns not only the rows matching the join condition (that is, rows with matching values in the common columns), but also the rows with unmatched values
- 3 types, left, right and full outer
- left outer join will yield not only the rows matching the join condition in the left table, including those that have no matching values in the right table
- in a pair of tables to be joined, a right outer join yields not only the rows matching the join condition in the right table, including the ones with no matching values in the left table.

LEFT OUTER JOIN EXAMPLE

LEFT OUTER JOIN

RIGHT OUTER JOIN

RIGHT OUTER JOIN

Outer Joins

FIGURE 7.33

The left outer join results

```
SELECT P_CODE, VENDOR.V_CODE, V_NAME
FROM VENDOR LEFT JOIN PRODUCT ON
VENDOR.V_CODE = PRODUCT.V_CODE
```

Relational Set Operators

- UNION
- INTERSECT
- MINUS
- Work properly if relations are union-compatible
 - Names of relation attributes must be the same and their data types must be identical

UNION

- Combines rows from two or more queries without including duplicate rows
- Example

- Example

```
SELECT CUS_LNAME, CUS_FNAME, CUS_INITIAL, CUS_AREACODE
FROM CUSTOMER
```

UNION

```
SELECT CUS_LNAME, CUS_FNAME, CUS_INITIAL, CUS_AREACODE
FROM CUSTOMER_2
```

UNION Example

UNION ALL

- Produces a relation that retains duplicate rows

- Example query:

```
SELECT CUS_LNAME, CUS_FNAME, CUS_INITIAL, CUS_AREACODE
FROM CUSTOMER
```

UNION ALL

```
SELECT CUS_LNAME, CUS_FNAME, CUS_INITIAL, CUS_AREACODE
FROM CUSTOMER_2;
```

INTERSECT

- Combines rows from two queries, returning only the rows that appear in both sets
- Syntax: query INTERSECT query

- Syntax: query INTERSECT query

- Example query:
SELECT CUS_LNAME, CUS_FNAME, CUS_INITIAL, CUS_AREACODE

FROMCUST

```
FROM CUSTOMER
INTERSECT
SELECT CUS_LNAME, CUS_FNAME, CUS_INITIAL, CUS_AREACODE
FROM CUSTOMER 2
```

INTERSECT Example

R	
A	1
B	2
D	3
F	4
E	5

R INTERSECTION S

A	1
D	3

S	
A	1
C	2
D	3
E	4

MINUS

- Combines rows from two queries
- Returns only the rows that appear in the first set but not in the second
- Syntax: query MINUS query
- Example:

```
SELECT CUS_LNAME, CUS_FNAME, CUS_INITIAL, CUS_AREACODE
FROM CUSTOMER
MINUS
SELECT CUS_LNAME, CUS_FNAME, CUS_INITIAL, CUS_AREACODE
FROM CUSTOMER_2
```

MINUS Example

(a) STUDENT		INSTRUCTOR		(b)		(c)	
Fname	Lname	Fname	Lname	Fname	Lname	Fname	Lname
Susan	Yao	John	Smith	Johnny	Kocher	John	Smith
Ramresh	Shah	Barbara	Jones	Barbara	Jones	Ricardo	Brown
Johnny	Kocher	Amy	Ford	Amy	Ford	Amy	Ford
Barbara	Jones	Jimmy	Wong	Jimmy	Wong	Ernest	Gilbert
Amy	Ford	Ernest	Gilbert	Ernest	Gilbert		
Jimmy	Wong						
Ernest	Gilbert						

INSTRUCTOR - STUDENT

STUDENT - INSTRUCTOR

Suppose names of people are distinct

(d) RESULT=INSTRUCTOR - STUDENT

(e) RESULT=STUDENT - INSTRUCTOR

SQL
 (SELECT Fname, Lname FROM STUDENT)
MINUS
 (SELECT Fname, Lname FROM INSTRUCTOR);

Subqueries

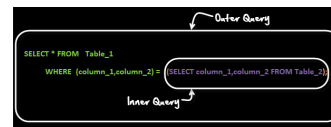

- Often need to process data based on other processed data
 - Eg. Need to generate a list of all products with a price greater than or equal to the average product price
- Is a query inside a query
- A subquery is normally inside parentheses
- The first query in the SQL statement is known as the outer query
- The query inside the SQL statement is known as the inner query
- The inner query is executed first
- The output of an inner query is used as the input for the outer query
- The entire SQL statement is sometimes referred to as a nested query

Subqueries - Examples

SELECT SUBQUERY EXAMPLES	EXPLANATION
INSERT INTO PRODUCT SELECT * FROM P;	Inserts all rows from Table P into the PRODUCT table. Both tables must have the same attributes. The subquery returns all rows from Table P.
UPDATE PRODUCT SET P_PRICE = (SELECT AVG(P_PRICE) FROM PRODUCT) WHERE V_CODE IN (SELECT V_CODE FROM VENDOR WHERE V_AREACODE = '615')	Updates the product price to the average product price, but only for the products that are provided by vendors who have an area code equal to 615. The first subquery returns the average price; the second subquery returns the list of vendors with an area code equal to 615.
DELETE FROM PRODUCT WHERE V_CODE IN (SELECT V_CODE FROM VENDOR WHERE V_AREACODE = '615')	Deletes the PRODUCT table rows that are provided by vendors with area code equal to 615. The subquery returns the list of vendor's codes with an area code equal to 615.

Subqueries

- A subquery can return:
 - One single value eg. The update example in the previous table
 - A list of values (one column and multiple rows) eg. IN
 - A virtual table (multicolumn, multirow set of values)

Subquery Example

- A common customer complaint at the MyFlix Video Library is the low number of movie titles. The management wants to buy movies for a category which has least number of titles.

SELECT category_name FROM categories WHERE category_id = (SELECT MIN(category_id) from movies);

- Result:

category_name
Comedy

How the subquery works

First the INNER Query is executed

SELECT MIN(category_id) from movies

INNER Query gives following result

MIN(category_id)
1

Output of INNER Query is substituted in OUTER Query

SELECT category_name FROM categories WHERE category_id =1

On Execution OUTER Query gives following Result

category_name
Comedy

WHERE Subquery

- Uses an inner SELECT subquery on the right side of the WHERE comparison expression
- When used in a >, <, =, >=, or <= conditional expression, requires a subquery that returns only one single value (one column, one row)

SELECT P_CODE, P_PRICE
FROM PRODUCT
WHERE P_PRICE >= (SELECT AVG(P_PRICE) FROM PRODUCT);

Result of first query
completes the
second query, which
is then run

P_CODE	P_PRICE
TQER/31	109.99
2232/QTY	109.92
2232/QWE	99.87
89-WRE-Q	256.99
WR3/TT3	119.95
*	0.00

This query done first
to get average

Database Principles: Design,
Implementation, & Management, 10th
Edition, Corbett, Morris and Rob

IN Subquery

- When you want to compare a single attribute to a list of values, use the IN operator
- When the values are not known beforehand but they can be derived using a query, you must use an IN subquery

SELECT V_CODE, V_NAME
FROM VENDOR
WHERE V_CODE IN (SELECT V_CODE FROM PRODUCT);

V_CODE	V_NAME
21238	Bryson, Inc.
21231	D&E Supply
21344	Gomez Bros.
23119	Randssets Ltd.
24288	ORDVA, Inc.
25595	Rubicon Systems
*	0

HAVING Subquery

- Just as you can use subqueries with the WHERE clause, you can use a subquery with a HAVING clause
- HAVING clause used to restrict the output of a GROUP BY query

```
SELECT P_CODE, SUM(LINE_UNITS)
FROM LINE
GROUP BY P_CODE
HAVING SUM(LINE_UNITS) > (SELECT AVG(LINE_UNITS) FROM LINE);
```

INV_INVOICE#	INV_INVOICE_DATE	P_CODE	LINE_UNITS	LINE_PRICE
1001	1-15-02P2	1	14.99	
1001	2-23-03-HB	1	9.95	
1002	1-24-03-TT	2	4.99

Edition, Corral, Morris and Rob

Multirow subquery operators – ANY and ALL

- IN subquery used when you need to compare a value to a list of values
- However, IN subquery uses an equality operator (ie. it selects only those rows that match at least one of the values in the list)
- For inequality comparison (> or <) of one value to a list of values (use ALL)
- EG. Suppose you want to know what products have a cost that is greater than all individual product costs for products provided by vendors from Florida

Multirow Subquery Operators: ANY and ALL

FIGURE 8.16 Multirow subquery operator example

```
SQL> SELECT P_CODE, P_QOH*P_PRICE
2 FROM PRODUCT
3 WHERE P_QOH*P_PRICE > ALL
4 (SELECT P_QOH*P_PRICE FROM PRODUCT
5 WHERE V_CODE IN (SELECT V_CODE FROM VENDOR WHERE V_STATE = 'FL'));
```

P_CODE	P_QOH*P_PRICE
89-URE-Q	2826.89

Date and Time Functions (continued)

Function	Description
<code>ADD_MONTHS</code>	Adds a specified number of months to a date.
<code>CONCAT</code>	Concatenates two or more strings.
<code>CONCAT_WS</code>	Concatenates two or more strings, with a separator.
<code>DECODE</code>	Compares a value with a list of values and returns the corresponding result.
<code>EXTRACT</code>	Extracts a specific part of a date or time value.
<code>INSTR</code>	Returns the position of the first occurrence of a substring within a string.
<code>LAST_DAY</code>	Returns the last day of the month for a given date.
<code>LENGTH</code>	Returns the length of a string in bytes.
<code>LENGTH2</code>	Returns the length of a string in characters.
<code>LOWER</code>	Converts all characters in a string to lowercase.
<code>LPAD</code>	Pads a string to a specified length with a specified character.
<code>MOD</code>	Returns the remainder of a division operation.
<code>MONTHS_BETWEEN</code>	Returns the number of months between two dates.
<code>ROUND</code>	Rounds a number to a specified precision.
<code>SUBSTR</code>	Extracts a substring from a string.
<code>SUBSTR2</code>	Extracts a substring from a string, starting from a specified position.
<code>TRIM</code>	Removes leading and trailing spaces from a string.
<code>TRUNC</code>	Truncates a date or time value to a specified unit.
<code>UPPER</code>	Converts all characters in a string to uppercase.

FUNCTION	EXAMPLES
TO_CHAR Returns a character string or a formatted string from a date value	Lists all employees born in 1982: SELECT EMP_NAME, EMP_FNAME, EMP_DOB, TO_CHAR(EMP_DOB,YYYY) AS YEAR FROM EMPLOYEE WHERE TO_CHAR(EMP_DOB,YYYY) = '1982';
Syntax: TO_CHAR(date_value, fmt) fmt = format used; can be: MONTH: name of month MM: three-letter month name MM: two-digit month name D: number of day of week DD: number of day of month DAY: name of day of week YYYY: four-digit year value YY: two-digit year value	Lists all employees born in November: SELECT EMP_NAME, EMP_FNAME, EMP_DOB, TO_CHAR(EMP_DOB,MM) AS MONTH FROM EMPLOYEE WHERE TO_CHAR(EMP_DOB,MM) = '11';
	Lists all employees born on the 14th of the month: SELECT EMP_NAME, EMP_FNAME, EMP_DOB, TO_CHAR(EMP_DOB,DD) AS DAY FROM EMPLOYEE WHERE TO_CHAR(EMP_DOB,DD) = '14';

Numeric Functions

[illegible]

ABS Returns the absolute value of a number	Use absolute values ABS (N1, N2, ..., ABS(N1), ABS(N2), ABS(N3))
ROUND Rounds a value to a specified precision (number of digits)	Use the product prices rounded to one and zero decimal places: ROUND (C1, D1, PRICE) ROUND (PRICE1) AS PRICE1 ROUND (PRICE2) AS PRICE2
TRUNC Truncates a value to a specified precision (number of digits)	Use the product prices truncated to one and zero decimal places and truncated: TRUNC (C1, D1, PRICE) TRUNC (PRICE1) AS PRICE1 TRUNC (PRICE2) AS PRICE2
IFERROR Returns the enabled integral greater than or equal to a number or returns the largest integral equal to or less than the number, respectively	Use the product prices, smallest integral greater than or equal to the product price, and the largest integral equal to or less than the product price: SELECT P1, PRICE, CEILING (PRICE), FLOOR (PRICE)

String Functions

TABLE 8.6 Selected Oracle String Functions

FUNCTION	EXAMPLE(S)
 Concatenates data from two different character columns and returns a single column	Lists all employee names (concatenated): SELECT EMP_LNAME ' ' EMP_FNAME AS NAME FROM EMPLOYEE;
Syntax: strg_value strg_value	[Note: MS Access users must use the "+" symbol to concatenate strings. For example: SELECT EMP_LNAME + ' ' + EMP_FNAME AS NAME FROM EMPLOYEE;

Database Principles: Design,
Implementation, & Management, 10th
Edition, Copyright, Microsoft and IBM

String Functions (continued)

TABLE 8.6 Selected Oracle String Functions (continued)

FUNCTION	EXAMPLE(S)
UPPERCASE Returns a string in all capital or all lowercase letters	Lists all employee names in all capital letters (concatenated): SELECT UPPEREMP_LNAME ' ' UPPEREMP_FNAME AS NAME FROM EMPLOYEE;
Syntax: UPPER(strg_value) LOWER(strg_value)	Lists all employee names in all lowercase letters (concatenated): SELECT LOWEREMP_LNAME ' ' LOWEREMP_FNAME AS NAME FROM EMPLOYEE;
SUBSTR Returns a substring or part of a given string parameter	Lists the first three characters of all employee phone numbers: SELECT EMP_PHONE, SUBSTR(EMP_PHONE,1,3) FROM EMPLOYEE;
Syntax: SUBSTR(strg_value, p, l) p = start position l = length of characters	Generates a list of employee user IDs, using the first character of first name and the first seven characters of last name: SELECT EMP_FNAME, EMP_LNAME, SUBSTR(EMP_FNAME,1,1) SUBSTR(EMP_LNAME,1,7) FROM EMPLOYEE;
LENGTH Returns the number of characters in a string value	Lists all employee last names and the length of their names, ordered descended by last name length: SELECT EMP_LNAME, LENGTH(EMP_LNAME) AS NAMESIZE FROM EMPLOYEE ORDER BY NAMESIZE DESC;
Syntax: LENGTH(strg_value)	

Database Principles:
Design, Implementation,
& Management, 10th
Edition, Copyright, Microsoft and IBM

Conversion Functions

TABLE 8.7 Selected Oracle Conversion Functions

FUNCTION	EXAMPLE(S)
TO_CHAR (numeric) Returns a character string or a formatted string from a numeric value; very useful for formatting numeric columns in reports	Lists all product prices, quantity on hand, percent discount, and total inventory cost using formatted values: SELECT P_CODE, TO_CHAR(P_PRICE, '\$999.99') AS PRICE, TO_CHAR(P_QOH, '9,999.99') AS QUANTITY, TO_CHAR(P_DISCOUNT, '9.99') AS DISC, TO_CHAR(P_PRICE * P_QOH, '\$99,999.99') AS TOTAL_COST FROM PRODUCT;
Syntax: TO_CHAR(numeric_value, fmt) fmt = format used; can be: 9 = displays a digit 0 = displays a leading zero = displays the comma . = displays the decimal point \$ = displays the dollar sign	

Database Principles: Design,
Implementation, & Management, 10th
Edition, Copyright, Microsoft and IBM

Conversion Functions (continued)

TABLE 8.7 Selected Oracle Conversion Functions (continued)

FUNCTION	EXAMPLE(S)
TO_DATE Returns a date value from a character string or a formatted string	Lists all employees hired on or before 12/31/2000: SELECT EMP_NAME, EMP_HIRE_DATE FROM EMPLOYEE WHERE EMP_HIRE_DATE <= TO_DATE('12/31/2000', 'MM/DD/YYYY');
Syntax: TO_DATE(char_value, fmt) fmt = format used; can be: MM/DD/YYYY = month/day/year MM/DD = month/day MM/DD/YYYY HH:MM:SS = month/day/year hour:minute:second MM/DD/YYYY HH:MM:SS AM/PM = month/day/year hour:minute:second AM/PM	
TO_NUMBER Returns a numeric value from a character string or a formatted string	Converts the string to numeric values using formatting data in a table from product table to find total cost. For example, the query above lists the values using the format mask '999.99'. SELECT TO_NUMBER(EMP_PRICE, '999.99') FROM EMPLOYEE;
Syntax: TO_NUMBER(char_value, fmt) fmt = format used; can be: 9 = displays a digit 0 = displays a leading zero = displays the comma . = displays the decimal point \$ = displays the dollar sign = displays the trailing zero	
TO_CHAR (date) Returns a character string or a formatted string from a date value	Converts the date to a character string using formatting data in a table from product table to find total cost. For example, the query above lists the values using the format mask 'MM/DD/YYYY'. SELECT TO_CHAR(EMP_HIRE_DATE, 'MM/DD/YYYY') FROM EMPLOYEE;
Syntax: TO_CHAR(date_value, fmt) fmt = format used; can be: MM/DD/YYYY = month/day/year MM/DD = month/day MM/DD/YYYY HH:MM:SS = month/day/year hour:minute:second MM/DD/YYYY HH:MM:SS AM/PM = month/day/year hour:minute:second AM/PM	

Database Principles: Design,
Implementation, & Management, 10th
Edition, Copyright, Microsoft and IBM

Triggers (Theory only)

- Automating business procedures and automatically maintaining data integrity and consistency are critical in modern business
- Most critical business procedures is proper inventory management
- Eg. Make sure that current product sales can be supported with sufficient product availability
- Therefore, necessary that a product order be sent to a vendor when the product's inventory drops below its minimum allowable quantity on hand

Database Principles: Design,
Implementation, & Management, 10th
Edition, Copyright, Microsoft and IBM

Triggers

- Can be accomplish these task by writing multiple SQL statements: one to update the product quantity on hand and another to update the product reorder flag.
- Such multistage process is inefficient because a series of SQL statements must be written and executed each time a product is sold.
- Also, SQL environment requires that somebody must remember to perform the SQL tasks

Database Principles: Design,
Implementation, & Management, 10th
Edition, Copyright, Microsoft and IBM

Triggers

- A trigger is procedural SQL code that is automatically invoked by the RDBMS upon the occurrence of a given data manipulation event
- Useful to remember:
 - A trigger is invoked before or after a data row is inserted, updated, or deleted
 - A trigger is associated with a database table
 - Each database table may have one or more triggers
 - A trigger is executed as part of the transaction that triggered it

Database Principles: Design,
Implementation, & Management, 10th
Edition, Corrado, Morris and Rob

Triggers

- Triggers are critical to proper database operation and management
- Triggers can be used to enforce constraints that cannot be enforced at the DBMS design and implementation
e.g. require that every invoice have at least one line item
- Triggers add functionality by automating critical actions and providing appropriate warnings and suggestions for remedial actions
- Triggers can be used to update table values, insert records in tables, and call other stored procedures

Database Principles: Design,
Implementation, & Management, 10th
Edition, Corrado, Morris and Rob

Triggers

- Triggers play a critical role in making the database truly useful. Create triggers for:
 - Auditing purposes (creating audit logs)
 - Automatic generation of derived column value
 - Enforcement of business or security constraints
- notify a manager every time an employee's bank account number changes
- Creation of replica tables for backup purposes

Database Principles: Design,
Implementation, & Management, 10th
Edition, Corrado, Morris and Rob

SQL SERVER 2005

```
CREATE TRIGGER TRG_PRODUCT_REORDER
ON PRODUCT
FOR INSERT, UPDATE
AS
BEGIN
    IF UPDATE(P_QOH)
    BEGIN
        UPDATE PRODUCT
            SET P_REORDER = 1
            WHERE P_QOH <= P_MIN;
    END
END;
```

Database Principles: Design,
Implementation, & Management, 10th
Edition, Corrado, Morris and Rob

```
CREATE TRIGGER TRG_PRODUCT_REORDER
ON PRODUCT
FOR INSERT, UPDATE
AS
BEGIN
    IF UPDATE(P_QOH)
    BEGIN
        UPDATE PRODUCT
            SET P_REORDER = 1
            WHERE P_QOH <= P_MIN;
    END
    IF UPDATE(P_MIN)
    BEGIN
        UPDATE PRODUCT
            SET P_REORDER = 1
            WHERE P_QOH <= P_MIN;
    END
END;
```

SQL SERVER 2005

Database Principles: Design,
Implementation, & Management, 10th
Edition, Corrado, Morris and Rob

Stored Procedures (Theory only)

- A stored procedure is a named collection of procedural and SQL statements

Database Principles: Design,
Implementation, & Management, 10th
Edition, Corrado, Morris and Rob

Stored Procedures

- **Advantages**
 - Substantially reduce network traffic and increase performance
 - No transmission of individual SQL statements over network
 - Help reduce code duplication by means of code isolation and code sharing
 - Minimize chance of errors and cost of application development and maintenance

Database Principles: Design,
Implementation, & Management, 10th
Edition, Corrado, Morris and Rob
